

The 100% breathable and hypoallergenic SUPREM range

To improve comfort, discretion and reduce skin tolerance issues, Lille Healthcare offers a full SUPREM range of 100% breathable products using the new LILLE AIR SYSTEM technology.

What is the new LILLE AIR SYSTEM technology?

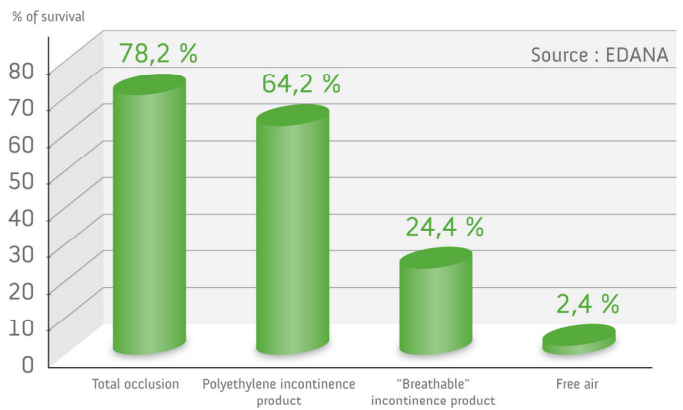

The back sheet of the product consists of layers of non-woven fabric and a central part that is fully waterproof and made of breathable material.

This envelope enables vapour exchanges in order to limit the risk of bacterial proliferation, irritations or allergies.

According to a study by EDANA (the European Disposable and Non-woven Association), using a breathable product enables a reduction in the presence of Candida albicans underneath the incontinence product:

Survival of the Candida Albicans on human skin under incontinence management (Source: EDANA)

This study shows that the number of infections by Candida Albicans has been reduced by 50% among the users wearing breathable backed products in comparison with the users wearing polyethylene backed products.

This change is a real improvement for the integrity of the skin of people who use our products.

Following dermatological tests performed in an independent laboratory, the SUPREM range has received the "hypoallergenic" certification.
